DISCUSSION

BACKGROUND

The Army Manufacturing Methods and Technology (MMT) Program was established in 1964 as a part of the Army Production Base Support (PBS) Program. The MMT Program has goals of improving existing manufacturing technology, translating new technology into production line processes, and supporting the modernization and expansion of the military hardware production base. The program is governed by the provisions of AR 700-90, Chapter 3.

COMPOSITION OF THE REPORT

This MMT Project Execution Report provides the status summaries of 547 active projects which have a total authorized cost of \$287,348,200. Total MMT program statistics, as well as the summaries of the active projects are also included. The report is compiled, edited, and published for HQ, DARCOM by the Manufacturing Technology Division of the Army Industrial Base Engineering Activity (IBEA) in accordance with AR 700-90, paragraph 3-4j(1).

Distribution of this report is extended to Army materiel developers and users and to counterparts in the Navy and the Air Force. Inquiries on the detailed technical aspects of any individual project may be answered by the MMT Program representative of the action command under which the project was completed or is being executed. Inquiries or suggestions concerning this report or other facets of the MMT Program may also be directed to the Manufacturing Technology Division of IBEA.

The report is composed of three major sections:

- a. Projects Added 1st Half, CY82 - A list divided by organization of all projects funded during the first half of CY82. Included is a narrative of the problem for each project.
- b. Final Status Reports Received During 1st Half, CY82 - A list divided by organization of all projects for which final status reports were received during the first half of CY82. Included is a narrative of the final status for each project.
- c. Summary Project Status Report - These reports are divided by organization and include a summary of funding by fiscal year and a narrative status of the work accomplished during the six month period for each active project.

MMT PROGRAM HISTORY

Figures 1 and 2 depict the size and growth of the MMT Program since 1970. These charts last appeared in the March 1982 Project Execution Report and are updated here to include FY82 funding. Figure 1 shows funding levels and Figure 2 deals with number of projects. In each figure, the upper curve represents all of the MMT projects for each fiscal year shown. The lower curve represents only those projects which initiated a new effort during the fiscal year shown. The difference between the two curves on each figure represents those approved dollars (Figure 1) and number of projects (Figure 2) which were approved in the fiscal year as follow-on projects to efforts initiated in prior years.

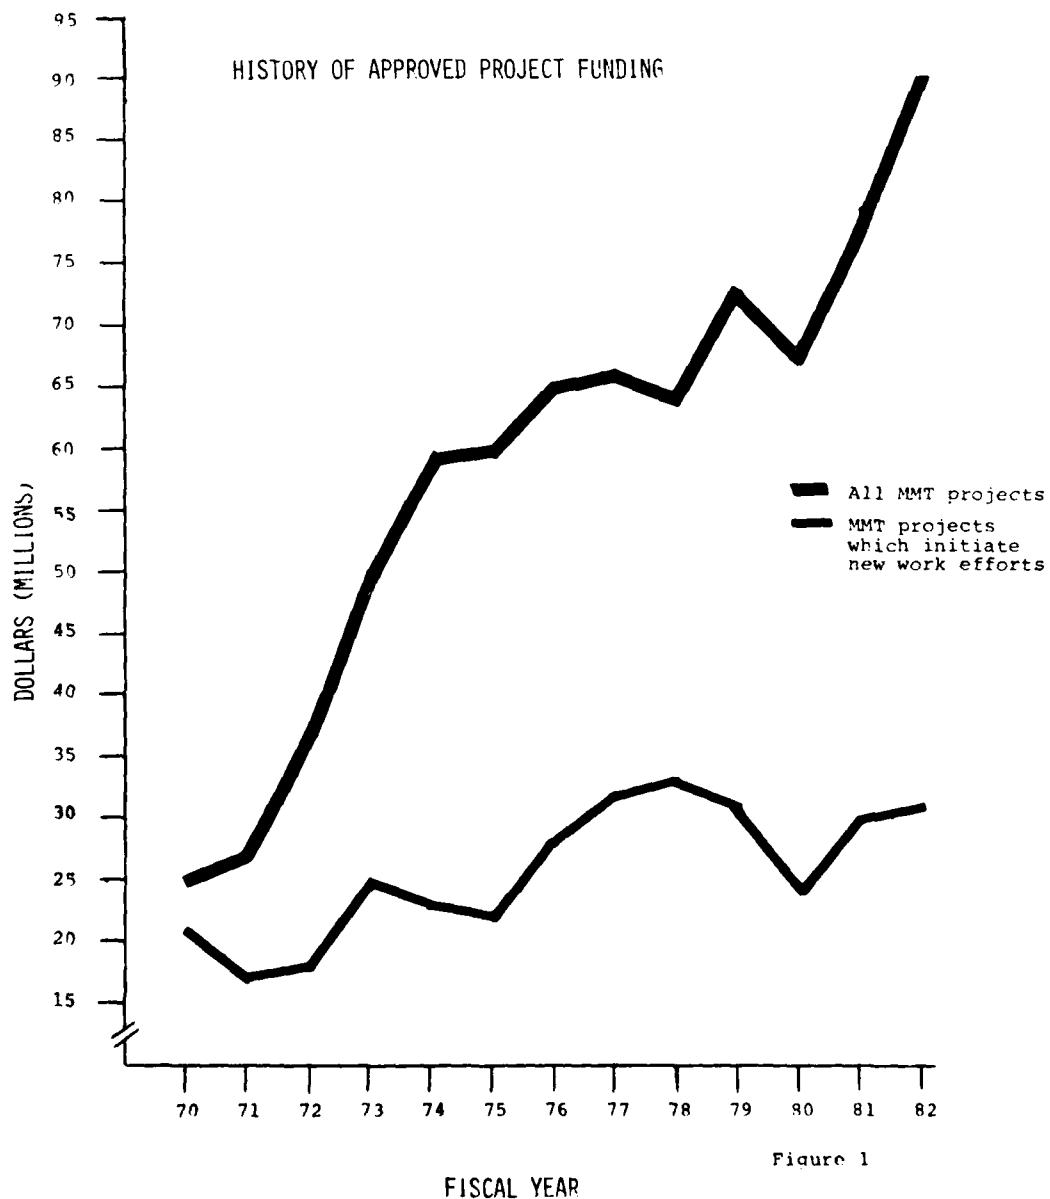

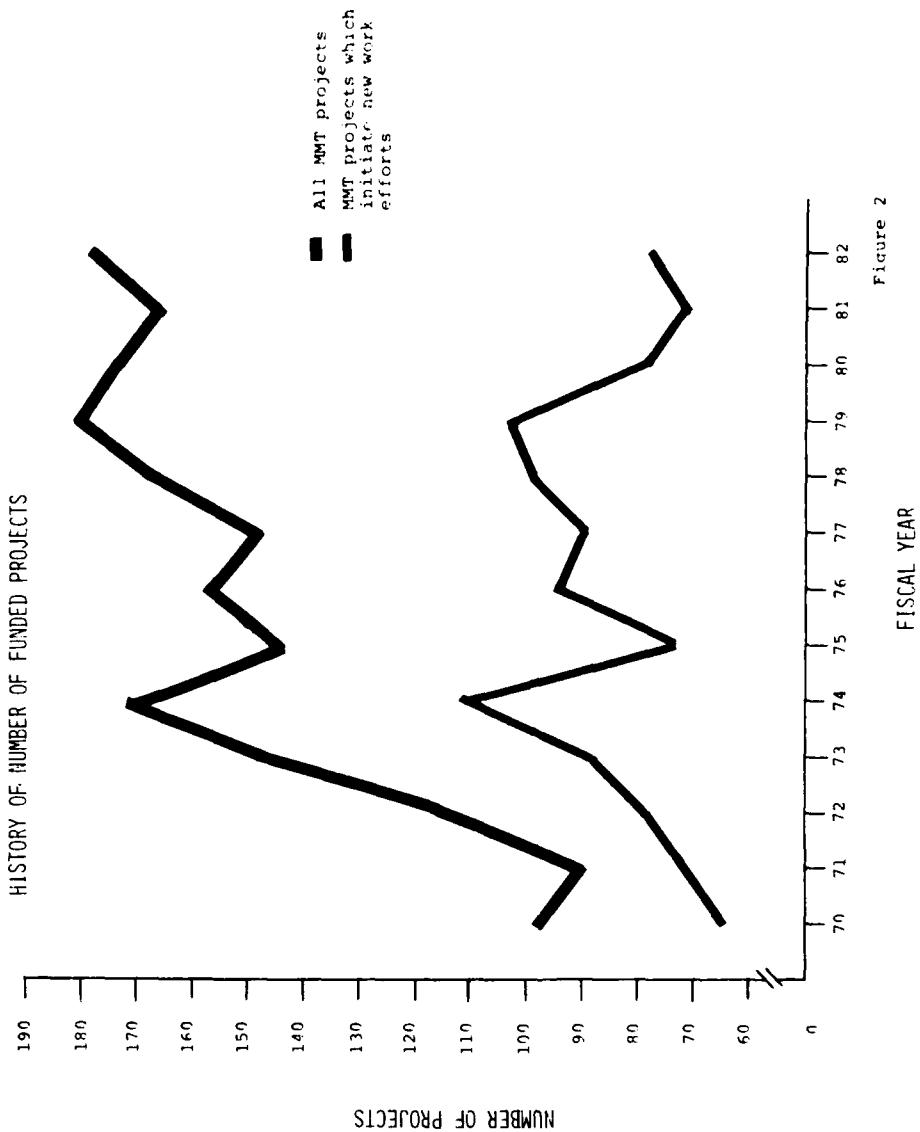

Figure 1

In the early years, these charts show a great increase in dollars, especially from FY71 to FY74. Then, there was no appreciable growth in the MMT program between FY74 and FY80. Since FY80 the funding level has risen from \$67 million to \$90 million. These recent increases are a reflection of both a renewed interest in our Defense posture and more importantly, perhaps, a firm commitment to take action on improving manufacturing productivity. Starting in FY72, less than 50% of each year's budget has been spent on initiating new work efforts. From FY72 to FY82, this figure has ranged between 49 and 35 percent. The majority of each year's funds has been spent for follow-on projects to efforts initiated in prior years. From FY74 to FY80 this trend, to a degree, reflected the fact that while individual work efforts were becoming more costly due to inflation and technical complexity, the overall budget had remained relatively constant permitting the initiation of fewer new work efforts. With an increasing budget in FY81 and 82, one might expect that this gap would decrease. However the advent and execution of complex large dollar, multi-year "systems" projects has continued to keep the initiation of new work efforts low.

STATUS REPORT SUBMISSIONS

Two areas which have been of concern in the past continue to show very little or no improvement. These areas are: (1) delinquent status reports, and (2) final status reports without technical reports. Figure 3 summarizes by Command these two situations. It can be noted from Figure 3 that 18% of all the required status reports (DRCMT 301) and 45% of all the required technical reports were not available.

Figure 3

*Does not include FY82 projects which were recently funded and which did not require a status report.

Accuracy of MMT summary information for management depends on a complete submission of all the project status reports for each command. In June, a call letter was mailed out to each SUBMACOM. Inclosed with this letter was a computerized listing of the projects for which a status report was required for this reporting period. Also, phone calls were made in September to those commands whose submission had not been received. As noted in Figure 3, there were still 107 reports which were not submitted by the due date of 15 September. The 18% delinquency encountered this period is an improvement over the last report period, which had a 24% delinquency. This improvement was due to the fact that the SUBMACOMS where provided a full 2 1/2 months (per the new AR 700-90, 15 Mar 82) from the end of the report period to compile and submit their status reports. When considering the initial reminder, the follow-up phone calls, and the time extension, the improvement can only be considered slight. This delinquency creates a significant void in the information presented in the compiled report. Continuing improvement in this area will insure a useful review of the progression of the MMT Program.

Relative to the second are of concern, there has always been a requirement that a technical report be prepared for each project. The technical report is an accepted vehicle, and in some cases the only vehicle, for true technology transfer and its importance cannot be overstated. In May 1981, a letter from the Directorate of Manufacturing Technology reinforced the requirement that final status reports will not be submitted without a completed technical report. Of the 54 final status reports submitted during the previous reporting period, 24 of them, or 44% did not have technical reports included. For this period, as noted in Figure 3, 65 final status reports were received with 29 of them, or 45% being delinquent the technical report. Greater strides will have to be made if true technology transfer is expected to occur. The 65 projects for which final status reports were received during this period can be found in a separate section on page 43 where the final work status is given for each project.

PROGRAM SUMMARY

Manufacturing Methods and Technology (MMT) Projects and Efforts are major elements of the Army's Manufacturing Technology (MANTECH) Program. AR700-90 succinctly describes the MANTECH objective as the improvement of the industrial readiness and efficiency of the production base for Army materiel. Further defined objectives are stated in the Statement of Principles for the DOD Manufacturing Technology Program. This Statement, originating at the Deputy Under Secretary of Defense level, not only establishes ground rules for the Program but highlights the level of emphasis that the Program receives.

To attain the objectives described in the Statement of Principles, the Army funds discrete work units, called "Projects," on a yearly basis. These projects, identified by a seven-digit number, contain work requests, which upon completion will result in an end product whose technical transfer can be effected. At times, in order to have a total work package which is implementable, (i.e., which can achieve the payback for which the work was funded) the scope can be of such a magnitude that total funding in one fiscal year can be an inefficient use of resources.

In this event, the total work might be multi-year funded, (i.e., be more than one project, each having a technically transferrable end product). These total implementable work units are called "Efforts". These efforts can consist of many projects or just be one project, depending on the amount of work required to achieve the implementable technical goal. Efforts are identified by a four-digit number which is the same as the last four digits of a project or projects which make up the effort.

The following three charts (Figures 4-6) summarize MMT project reporting and funding status for the 1st Half of CY82. These summaries include data from the major Army subcommands (SUBMACOM) that have active projects and the AMMRC and AMETA sponsored projects. Cumulative figures pertaining to project distribution and expenditures of funds on contract and in-house are provided. Projects that were closed out during the reporting period are not included in the data used for these summaries.

A summary of the MMT Program (Figure 4) indicates that the number of active projects has increased by only 1% in comparison with the 1st half

of CY81. The comparison is made between parallel reporting periods (1st half, CY81 and 1st half, CY82) in order to observe the project number and funding changes that occur within each Command and within the total program.

It can be noted that the largest increases in number of projects were TACOM and ARRADCOM/ARRCOM (Weapons). The largest decrease was MICOM. Percentage-wise, the largest increase in the value of active projects was TACOM with 89%. Dollarwise the largest increase was ARRADCOM/ARRCOM (Ammo) with \$17 million. The largest decrease in dollars was MICOM which showed a reduction of \$2 million.

A breakout of the active projects by fiscal year is shown in Figure 5. It can be noted that one FY75 project is still active. The only requirement

left for this project (D 75 6494) is the completion and distribution of the final technical report. The status report received this period indicated that it will be closed out during the next report period. Continuing emphasis is being placed on closing out older projects. The success of this effort is shown by comparing the fiscal years 75-78 for the 1st half CY81 with the current period. A year ago, there were 92 active projects for these fiscal years. There were only 48 projects for these years reported during the 1st half CY82. The number of close outs during this period would have even been greater if 18% of the status reports had not been delinquent.

Figure 6 indicates at what rate the project funds are being expended. In the past the active MMT has shown a relatively consistant 50-50 contractor/in-house ratio. But for the first CY81, these values (\$132 million

Figure 6 also shows that compared to the same period last year, contractor expenditures are exactly the same (60%) and in-house expenditures are down (29% vs. 39%). The 107 delinquent projects also have an impact on this chart. There would have been additional in-house and contract funds expended that were not reported to IBEA.

APPENDIX II: PROJECT SLIPPAGE STUDY

PROJECT SLIPPAGE STUDY

The purpose of this study is to monitor trends in the timeliness of the MMT Project Execution. Figure 1 is a slippage profile for each command and for the program as a whole. In the past, the slippage profile has tended to be very consistent. The "No Data" column and "0 Mo" column fluctuated depending on the timing of the funding of the new fiscal year program. A combination of these two figures has remained fairly consistent from period to period. The other five columns have also consistently remained within a +4 percentage point range from reporting period to reporting period. However, this period there is an 8 point decrease in the "7-12 Month" slippage column with most of the offsetting increase occurring in the "No Data - 0 Month" slippage combination. This net result does reflect the best slippage profile since the inclusion of this indicator.

There are two problems that affect accurate project slippage reporting. One problem is delinquent status reports. If a status report is not submitted for a project, then the slippage will be that which was calculated from the last status report received. During the current reporting period, there were 107 delinquent status reports. This delinquency results in a larger number of active projects because final status reports are not submitted for those delinquent projects that have in actuality been closed out. A continued decrease in delinquency of project status reports will help improve the accuracy of the project slippage profile.

Another problem that affects accurate project slippage reporting is the basis on which final status reports are submitted. Some organizations await financial close-out before submitting final status reports. By doing this, several months might be added to the apparent duration of the project. The general policy has been that final status reports should be submitted when the technical work has been physically completed. If outstanding financial action does not hinder project implementation, then the time required for financial close-out is not meant to be added to an indicator which measures engineering achievement. Continued emphasis on using a consistent basis for project close-out, namely technical completion, will provide a more accurate accounting of the technical life of MMT projects.
